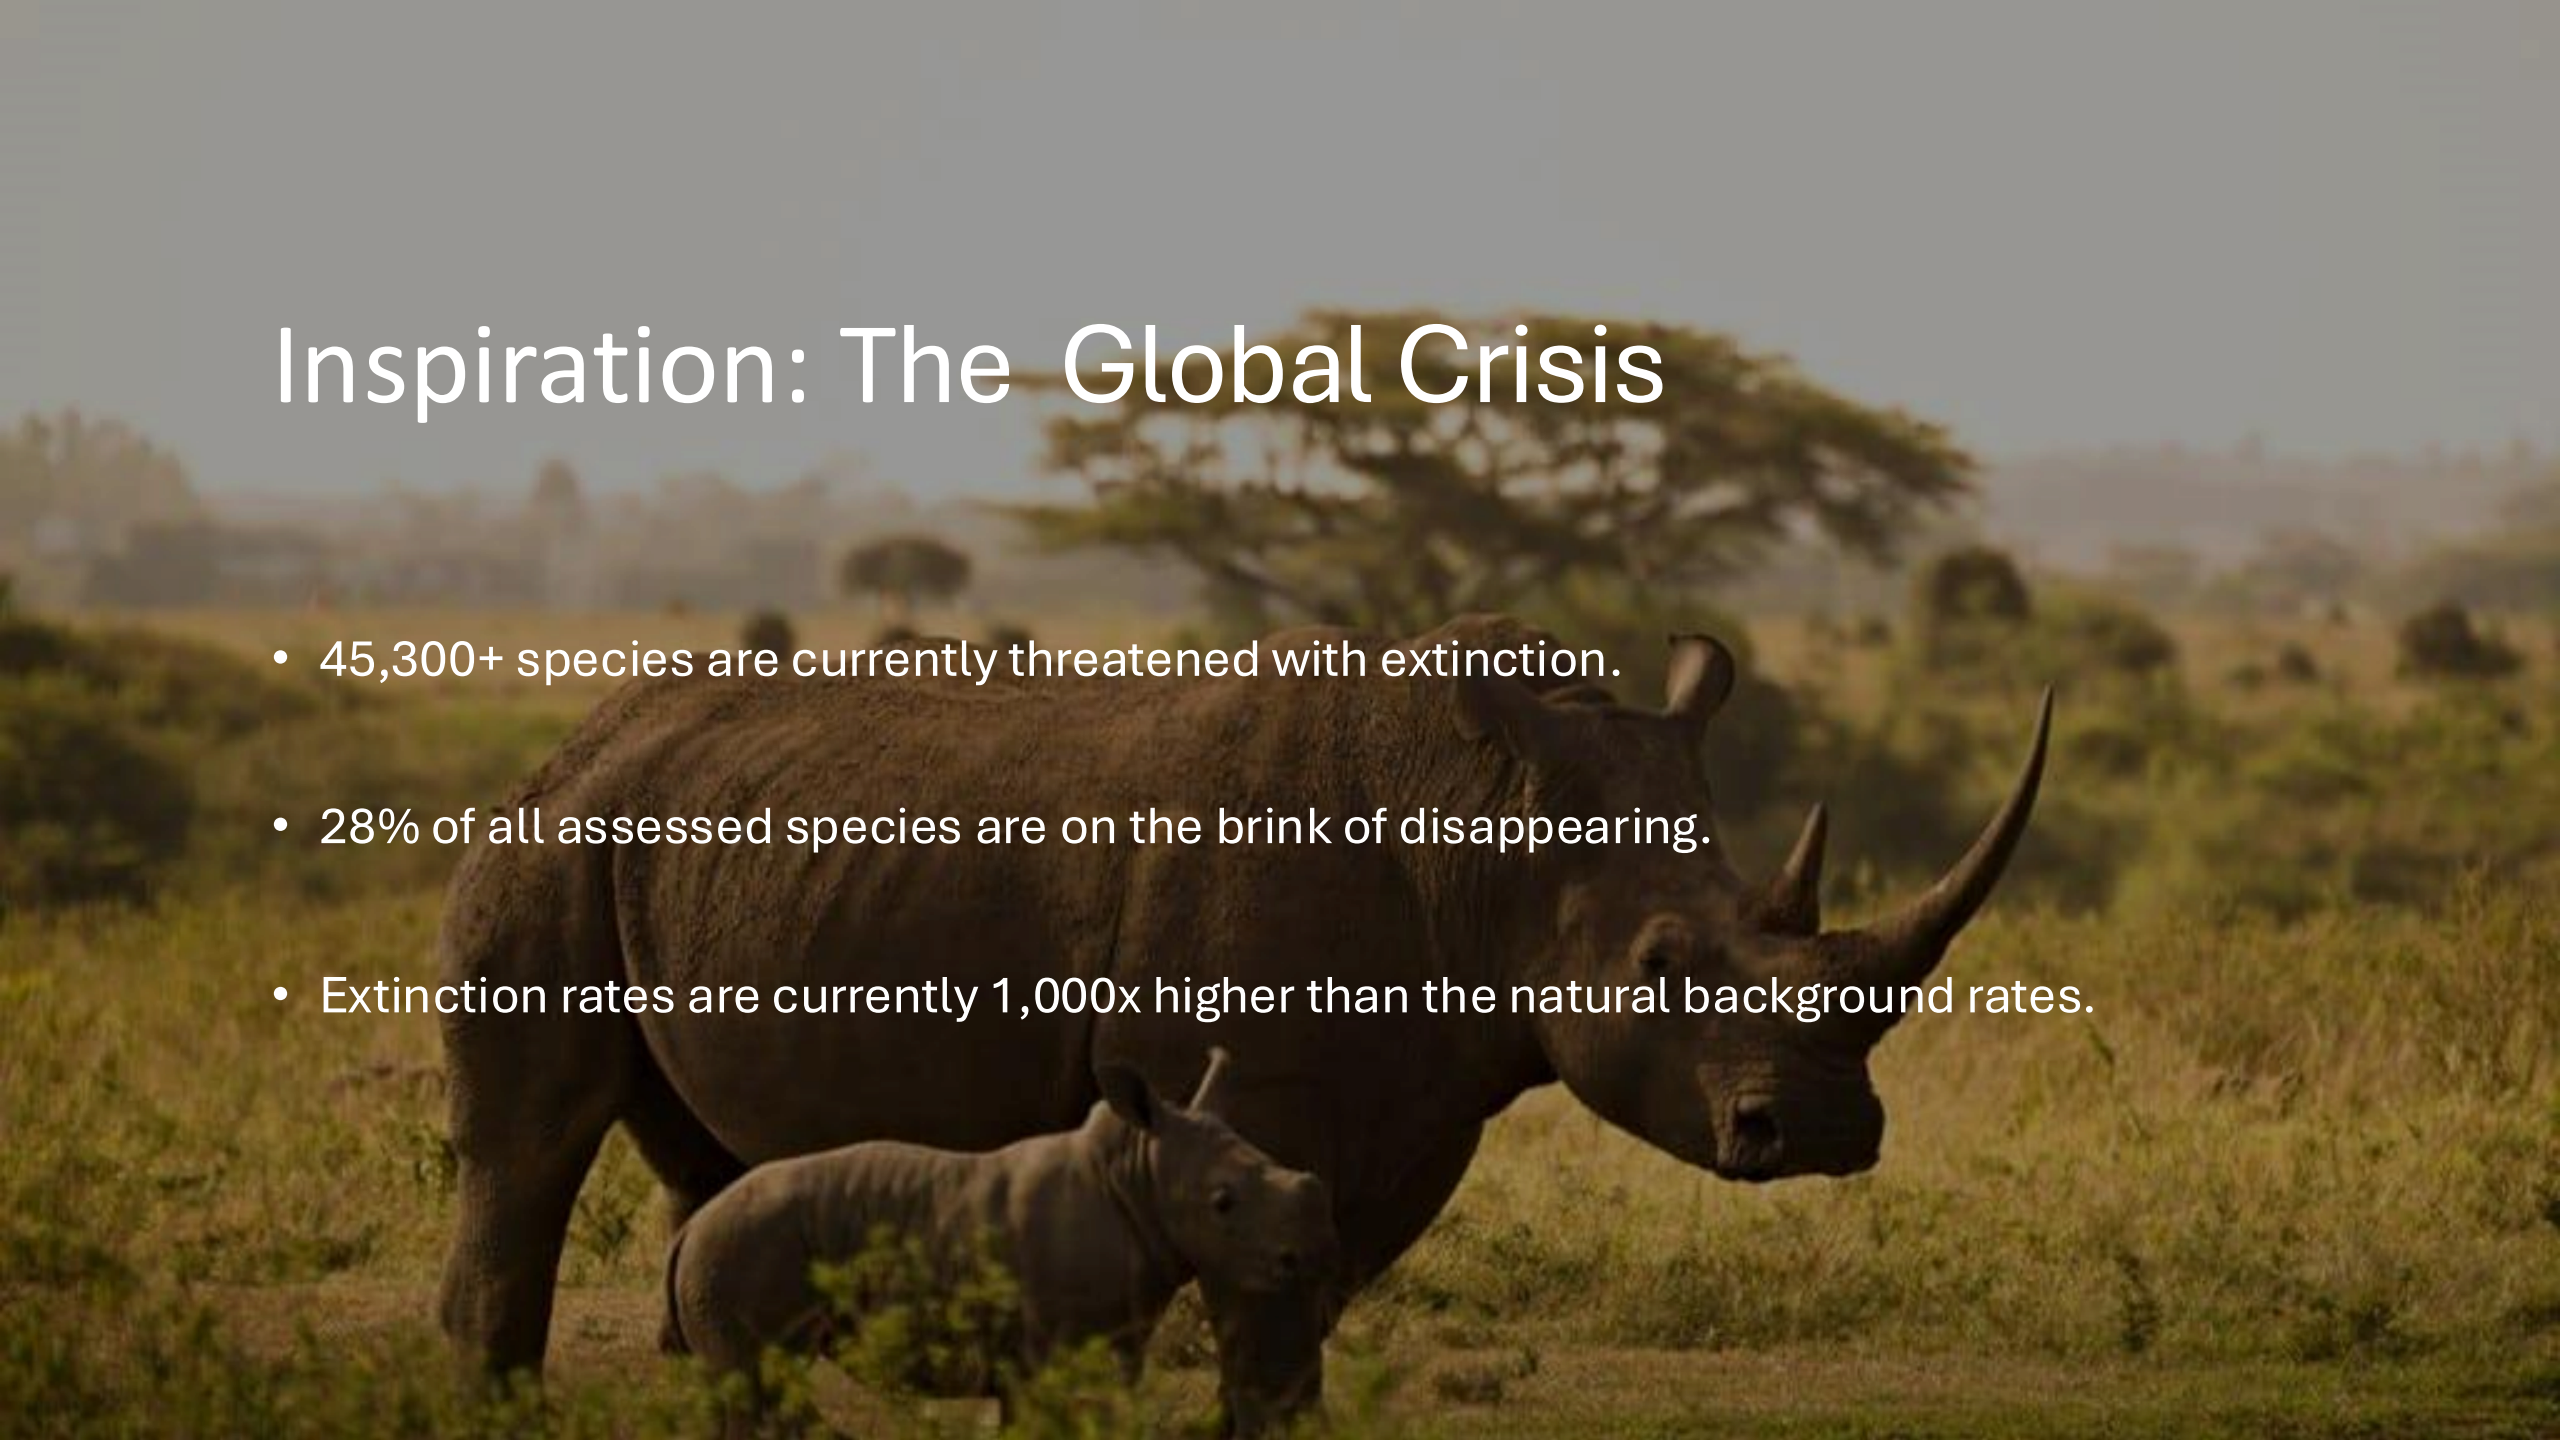
Save Our Species Empowering Conservation Through Action

By: Manya Chennareddy, Alex Cao

Team F1

EMP Hackfest WildHack 2026

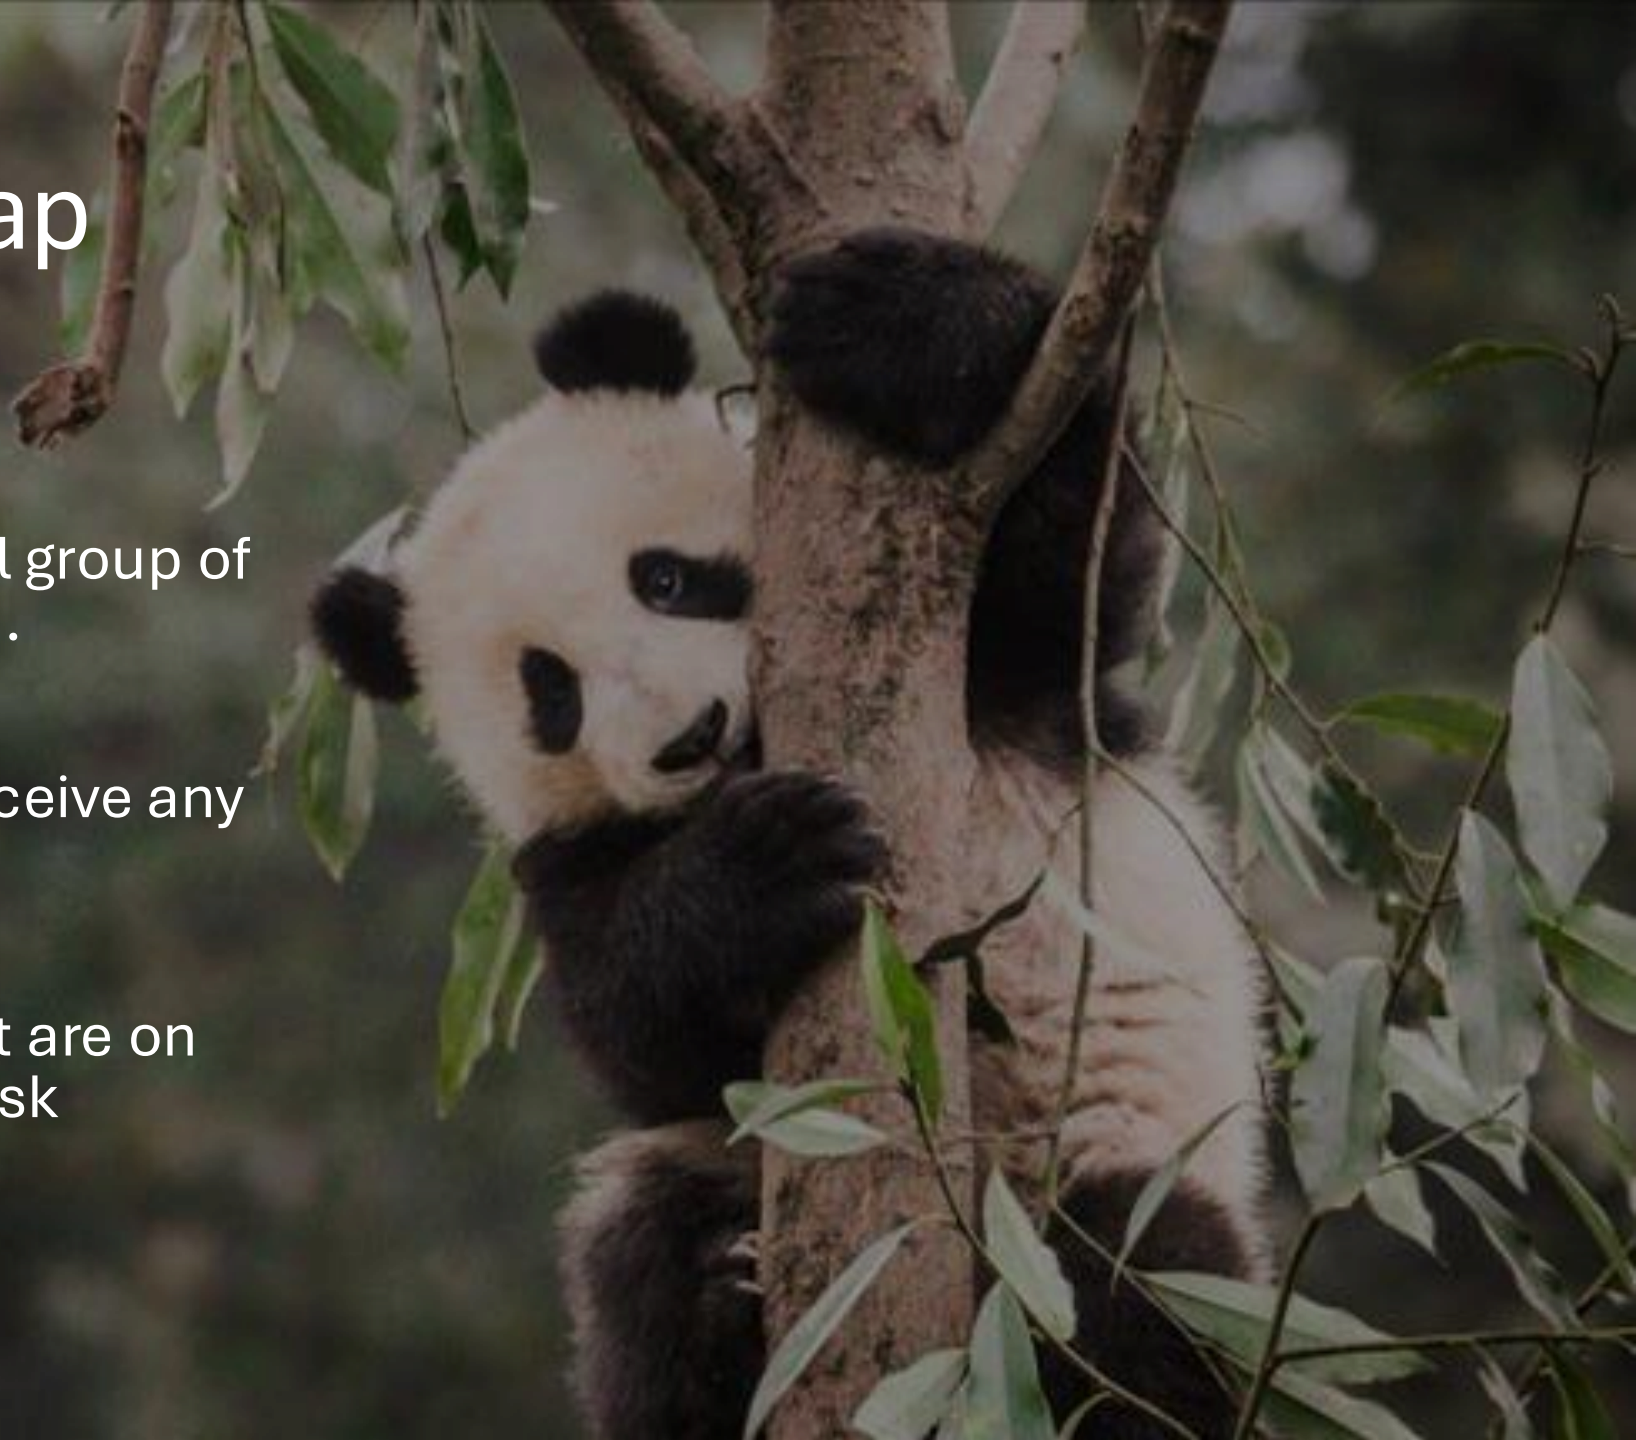


Inspiration: The Global Crisis

- 45,300+ species are currently threatened with extinction.
- 28% of all assessed species are on the brink of disappearing.
- Extinction rates are currently 1,000x higher than the natural background rates.

The Knowledge Gap

- **83%** of funding goes to small group of animals like the Giant Panda.
- **6%** of threatened species receive any dedicated support
- **30%** of public’s money spent are on animals that aren't even at risk

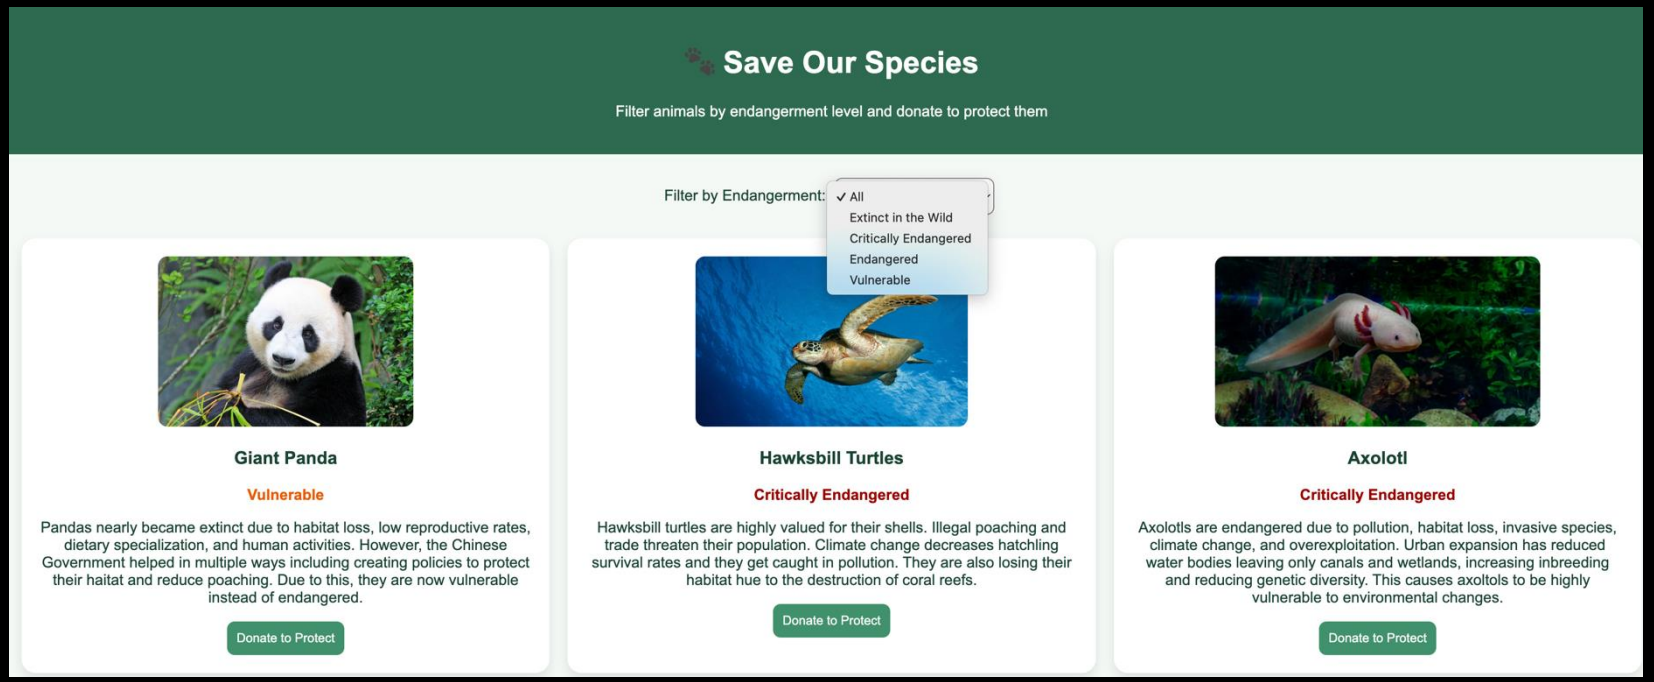


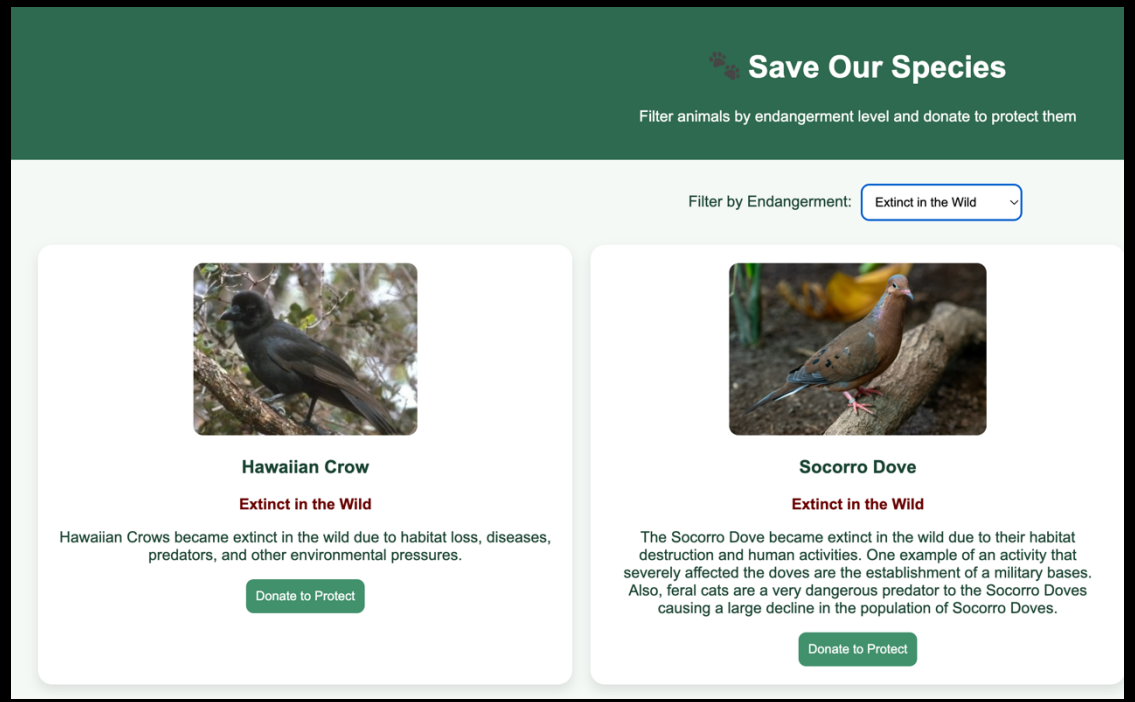
The $700 Billion Shortfall

- Global biodiversity faces a **$700 Billion** annual funding shortfall
- Donors abandon support when it takes too much effort to find a verified charity that works to protect endangered animals and their habitats.

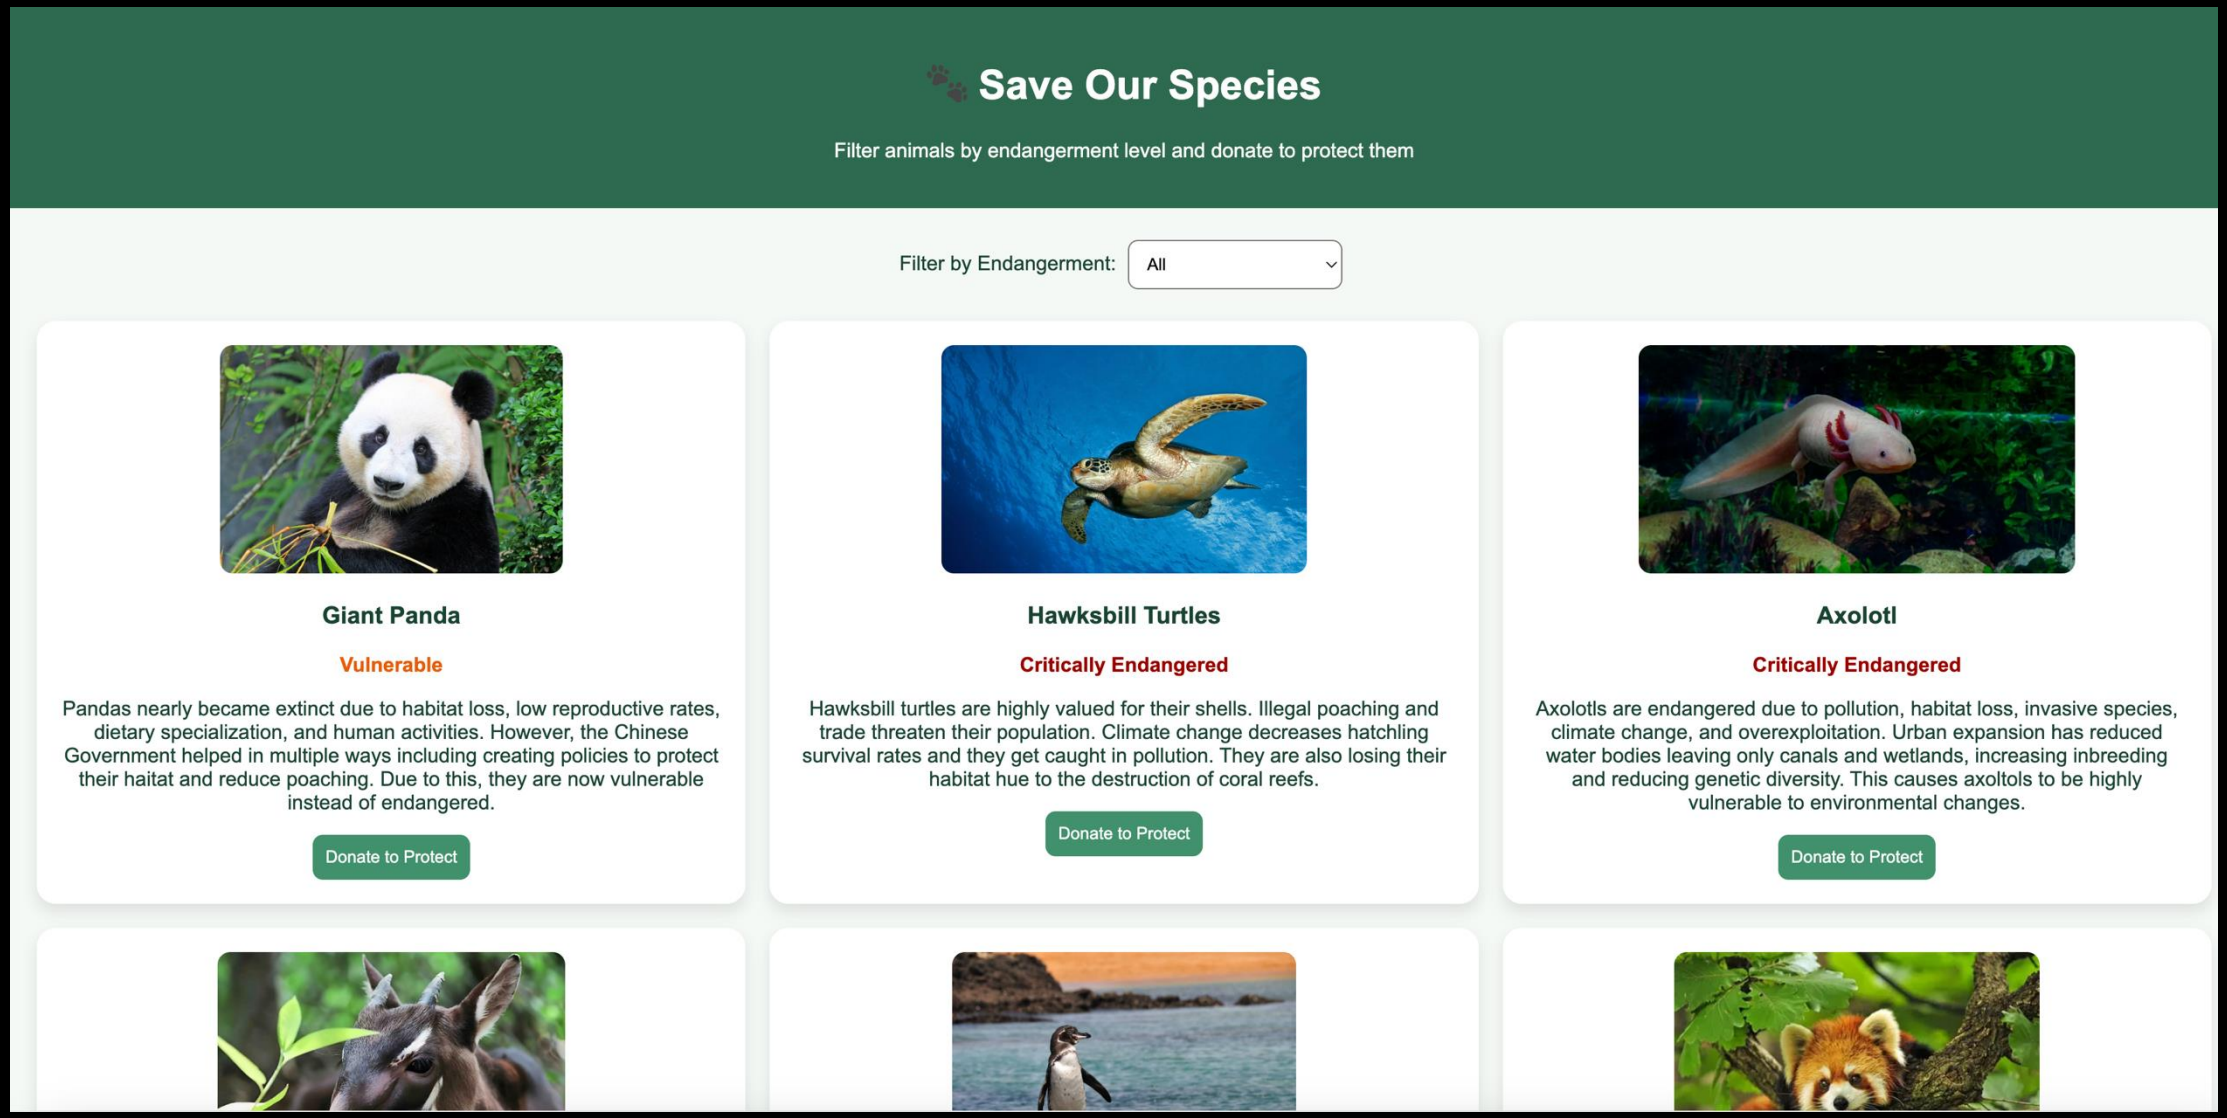
Our Solution

- **Scientific Tiering –** based on ICUN status.
- **Frictionless UI**– one click from info to donation
- **Key Information -** summarizes threats to each animal





DEMO



Save Our Species
Filter animals by endangerment level and donate to protect them
Filter by Endangerment:
All
Giant Panda
Vulnerable
Pandas nearly became extinct due to habitat loss, low reproductive rates, dietary specialization, and human activities. However, the Chinese Government helped in multiple ways including creating policies to protect their haitat and reduce poaching. Due to this, they are now vulnerable instead of endangered.
Donate to Protect
Hawksbill Turtles
Critically Endangered
Hawksbill turtles are highly valued for their shells. Illegal poaching and trade threaten their population. Climate change decreases hatchling survival rates and they get caught in pollution. They are also losing their habitat hue to the destruction of coral reefs.
Donate to Protect
Axolotl
Critically Endangered
Axolotls are endangered due to pollution, habitat loss, invasive species, climate change, and overexploitation. Urban expansion has reduced water bodies leaving only canals and wetlands, increasing inbreeding and reducing genetic diversity. This causes axoltols to be highly vulnerable to environmental changes.
Donate to Protect

Tech used

- CSS
- JavaScript
- HTML
- Github - https://github.com/AlexCao-html/hackfest-endangered-animals

Challenges

- Vetting NGOs to ensure reliability
- Balancing visuals with readability
